Better Start Bradford Innovation Hub

I CAN End of Contract Report - February 2021

This is a report provided by the Better Start Bradford Innovation Hub (BSBIH) for the Better Start Bradford (BSB) and the I CAN team. The document contains an overview of I CAN, its performance and findings from the implementation evaluation for the project's first contract period. The design of the evaluation is described in detail in the Evaluation Plan Framework, which was approved by key stakeholders from the BSBIH and BSB.

Authors: Dara Nielsen, Kathryn Wilkie, Sara Hearn, and the Better Start Bradford Innovation Hub

Executive Summary

Project Summary

I CAN Early Talk 0-5 Working with Under 5s (WWU5), Working with Parents (WWP), and Setting Accreditation is a package of practitioner training that is part of the Better Start Bradford (BSB) Learning Language Home. The training was adapted from evidence-based practice (EBP) to fit the BSB context. The training aims to increase practitioners' confidence in providing embedded language stimulation and early education. The aim of the training is to provide information and guidance for practitioners on the importance of home language skills, how to support them, and how to identify children in need of additional support. Additionally, the accreditation scheme allows settings to demonstrate their commitment to supporting young children's early language development.

This report summarises the BSBIH's evaluation of the implementation of the I CAN project. The report is based upon data collected from the project plan(s) for I CAN's first contract period, from the first one-and-a-half years of delivery (1 July 2019 to 31 January 2021). It should be noted that due to the Covid-19 pandemic, the delivery of face-to-face training and accreditation visits had to be paused on 17th March 2020 by the wider Government guidance. However, due to the nature of the project and the intention to provide all training and accreditation within a single contract period, the targets were not adjusted despite the need to change project delivery. The pandemic and the provider's ongoing access to settings is a very challenging time for the education sector should be taken into account in the interpretation of this report.

Project performance

Data

The project has worked closely with the innovation hub to improve the quality and completeness of project monitoring data. Overall, the data was submitted in line with the data protocols, however there were a small number of data quality issues relating to decreases in information about settings' and duplication of records.

Implementation

64%

Annual implementation targets related to the number of settings attending WWU5 and WWP training were achieved. Accreditation targets were not achieved. Although the project trained 23 settings (96% of the annual target), only 11 (46%) achieved accreditation, which is a lower proportion than previous years' cohorts. This may be because the project trained 23 settings in the last quarter of the year, which may have impacted their ability to complete the accreditation process.

Completion

19%

Annual completion targets related to the number of settings achieving accreditation, with a target of 24 settings, were not met. Only 5 settings received accreditation, which represents 19% of the annual target. Contributing factors include the impact of the pandemic on the implementation of the programme criteria.

Satisfaction

100%* *participant given similar good or better

Annual satisfaction targets were met. All participants giving a median response of 4 or more, which represents 100% of the respondents. (100%) had a median score of 4 or more, which represents a 10%(8%) increase in the programme criteria.

Consider extending the project in order to allow the remaining settings to complete the training and complete the accreditation process. Any extension should take into account the ongoing disruption to early education and care settings due to Covid-19, and ensure mitigating strategies are in place to minimise further disruption and to address emerging challenges.

Recommendation 2 -

Need for support for children's early language development is likely to be a result of closures to early education and care settings due to Covid-19. Consider whether the project can offer this project to other settings, or offer ongoing support to the settings to help their provision good quality language provision in the face of increased need, particularly through the use of the Setting Accreditation and Parents' Programmes.

Project Performance

Data

The project has worked closely with the Innovation Hub to improve the quality and completeness of project monitoring data. Overall, the data was submitted in line with the data protocols, however there were a small number of data quality issues relating to decreases in information about settings' and duplication of records.

Implementation

64%

The annual implementation target related to the number of settings attending WWU5 and WWP training was met. Although the project trained 23 settings (96% of the annual target), only 11 (46%) achieved accreditation within the Better Start Bradford cohort, which is a lower proportion than previous years' cohorts. 58 settings receiving training each year. After have and half years of the contract, the project has managed to train 53 of the settings, which represents 90% of the ongoing support target.

Prior to the first lockdown, 21 settings had received the training, suggesting that at that point they had completed 37% of their allocated target for the contract at that time.

Completion

19%

The completion target for the project related to the number of settings to receive the Setting Accreditation. The target was for all the settings to complete the accreditation over the course of the contract, 24 within the second year and the first 24 within the last year although this is not a formal target, it was expected that the project would be able to complete the accreditation with the same number of settings as they managed to support. Settings have been able to complete 19% of the 27 setting target. In addition to this, all 23 trained settings have started the accreditation process, which is a lower proportion than previous years' cohorts. However, due to Covid-19, the project has been unable to carry out the accreditation visits.
As the targets for the Setting Accreditation were for them all to be completed in the second year, the project has been unable to meet the targets for the Setting Accreditation. In the first lockdown, the contract target was significantly impacted by the Covid-19 situation.

Satisfaction

100%* *participant given similar good or better

The target for satisfaction was for 80% of the practitioners who responded to the satisfaction questionnaire to report a median total satisfaction score of 4 or more. In fact, 100% of respondents had a median score of 4 or more, suggesting that all of the respondents were satisfied with the training.
However, it is important to note that only 38 satisfaction questionnaires were returned, which represents only 16% of the 236 people who received the training. Although the satisfaction questionnaire is anonymous, it is unclear whether this data is representative of the whole sample.

Recruitment

Who were the beneficiaries of the project?

208 Practitioners

87% Practitioners

The Innovation beneficiaries for this project were the practitioners who received the training, as well as the children and families living at the centres.

On average, 87% of the staff employed in the settings at the time of the training completed the training. This suggests that there was some additional staff from other areas of the organisations attended the training, which accounted for 24 of the total number of practitioners who received the training.

However, this already beneficiary of the project were the children attending the settings that received the training. In total, 953 children were in the settings at the time that they took part in the training.

953 Children accessed the settings at the time of training

What were the characteristics of the staff and settings attending the training?

Who were the staff that attended?

- Support Worker (SW) 29%
- Nursery Practitioner/Nurse (NN) 19%
- Teacher (T) 19%
- Nursery Manager / Deputy Nursery Manager (NM) 14%
- Project Supervisor/Family Worker (PS/FW) 10%
- Early Years Professional (EYP) 5%
- Trainee teacher (TT) 5%
- Other (O) 5%
- Speech and Language Therapy Assistant (SLTA) 1%
- Speech and Language Therapy Assistant (SLTA) 1%
- Early Years Advisor (EYA) 1%

What types of settings attended?

- PVI Nursery (N) 57%
- Maintained Nursery (MN) 19%
- Children's Centre (CC) 19%

The practitioners who participated in the training, on average, had 14 years of experience in the early years. Practitioners (29%) were Early Years Practitioners (EYPs), 19% were Nursery Practitioners/Nurses, 14% were Nursery Managers or Deputy Managers (NM). There were also practitioners from other organisations, support workers, teaching leaders, teachers, assistants, and trainees. Although the data shows that more practitioners did not disclose their credentials (10%) or their titles were attributed to project ownership (14%).

LEA the settings that participated in the training, the majority (56.70%) were PVI settings. Four childminders also participated in the training (7.7%) while only 5 school nurseries received the training.

Practitioners' experience of the WellComm

How did practitioners experience the WellComm outcome assessment?

At the beginning of the project, the WellCom tool was intended to be used by practitioners to assess the impact of the I CAN training on children's language skills. The WellCom is an assessment designed for use by early years practitioners to identify children's speech, language and communication needs and to inform intervention.
At the second annual review of the project, it became clear that settings were not collecting the WellCom data in the way that the project had intended. To understand why, the Innovation Hub conducted a survey of the practitioners who had completed questionnaires about their experiences with the WellComm. The person who arranged the I CAN training at each setting was asked to respond to the survey, and there were 30 responses that contained at least one question.

On a positive note...

90% Practitioners

90% of practitioners agree or strongly agree that the WellComm tool has made a positive impact on their language skills.
Practitioners also agreed that they have to use the WellComm tool their needs:
- Their staff felt confident using the WellCome to assess children's language skills
- The WellCome tool was an appropriate tool to use with the children in their setting

70% of practitioners agree or strongly agree the Big Book of Ideas to support children's language development is useful.

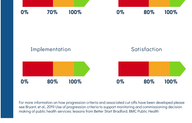
However...

70% **Only 10% (3 practitioners) said** that they were able to complete the WellC assessments with the children in their setting at any particular time before or after the I CAN training.

100% **50% of respondents** agreed or strongly agreed that the WellComm tool was easy to use with children in their setting, while 40% connected or agreed that WellCom tool was difficult to use.

100% **100%** of respondents agreed or strongly agreed that the information they received was appropriate

Practitioners also noted all the barriers they faced in administering the WellComm in their setting, which includes:



The bars show the total number of times a barrier was reported. The most common barrier was the time it takes to administer the WellComm, which 5 practitioners said they had experienced. The second most commonly reported barrier was the lack of staff to administer the WellComm, which 4 practitioners reported. 2 Practitioners reported that they had experienced all of the barriers except for the lack of appropriate rooms to assess children, which 1 practitioner said they had experienced.

These responses contradict the survey data above, which suggests that practitioners felt that the WellComm was easy to use. The WellCom was a fairly good tool for settings when trying to complete the assessments.

Overall, this suggests that many settings were not able to administer the WellComm, despite considering it to be a useful tool to assess an important skill. The biggest barrier to using the WellComm was the time it takes to administer.

Recruitment and Implementation

Participant Flow diagram

Satisfaction

What did the practitioners think of the training?

Unfortunately only 38 practitioners returned satisfaction questionnaires. This means 16% of participants completed the satisfaction questionnaire. These results should therefore be interpreted cautiously, as it is unclear if this is a representative sample of the practitioners receiving the training.

100% of respondents had a median score of 4 or more

100% n=38 of respondents agreed or strongly agreed that the project was helpful to them

100% n=38 of respondents agreed or strongly agreed that the information they received was appropriate

100% n=38 of respondents agreed or strongly agreed that they would recommend the training to colleagues

100% n=38 of respondents agreed or strongly agreed that enjoyed the interactive elements of the training

100% n=38 of respondents agreed or strongly agreed that the materials and tools were useful

100% n=38 of respondents were happy with the training overall

Appendix - Progression Criteria Cutoffs

For more information on how progression criteria and associated cut offs have been developed please see Bryant et al. 2019 Use of progression criteria to support monitoring and commissioning decision making of public health services: lessons from Better Start Bradford, BMC Public Health.
